

Amendments to the Specification

On page 3, line 12, please change the paragraph to read as follows:

"The destination phone 12 receives the call identifier prior to the call being completed, indicated by alerting or ringing the user at the destination, and rejects the call. The destination phone recognizes the call identifier as coming from a phone that can connect over a data network, such as IP, FR or ATM. The rejected call signal is returned to the origination phone 10. While the rejected call signal is being sent to the origination phone 10, the destination phone 12 places a call to a network service provider. When the origination phone 10 receives the rejected call signal, it also places a call to a network service provider."
